Production as service

- Production as service
 - ... for building installations
 - ... for store and shop installations
 - ... for ship interior installations
 - Cost advantages thanks to coating technology
 - Industrial manufacturing processes
- Find out what we can do!*

Our objective is boosting your efficiency

We enable you to concentrate on your core skills in function-optimized design, the project management of all building trades or on the overall care of your valued customers in general. Our aspiration begins with the adoption down to the last detail of your requirements by our wood technicians and engineers and ends with the delivery by order of complete fittings at precisely the time you specified to the location of your choice.

Precision in the product and the process

The outsourcing of manufacturing steps as part of your project does not tolerate any compromises with regard to adherence to delivery dates or product quality. Sufficient production capacity, the latest manufacturing technology, an established network of reliable subcontractors of many years' experience and, above all, highly motivated employees are the prerequisites for the reliable manufacture of your products and compliance with your deadlines. A continually growing customer base from shop construction, ship interior construction and the building business appreciates our reliability.

One-off pieces and large batches

The use of the latest control technology and the organisation of our manufacturing permits us to achieve minimum set-up times and exceptionally high flexibility. We are not too big for small special batches or even one-off pieces! And not too small for large batches on an industrial scale either. This applies to simple profiles as well as to complex installation elements or finished furniture and shop fittings.

State-of-the-art technology and sound handicraft skills

The ideal symbiosis of craftsmanlike skill and mechanical efficiency and repetitive accuracy is a prerequisite for high product quality, economy and meeting deadlines. Wood is a living material and therefore always deserves individual treatment. Just like you and your customers.

Cost advantages thanks to coatings

The coating of wooden materials or metal beams with high quality materials such as, for example, real wood veneers, real aluminium, leather, stainless steel film, high gloss materials, etc., not only offers you clear cost advantages, but also improved the quality in optical and construction terms. It is frequently possible to combine a resource-conserving reduction of solid wood or solvent-based lacquer systems with improved appearance and construction. **Find out about what is possible with coating technology.**
